

List Questions

1. Create a list of 5 student names.
2. Add one new student name into the list using `append()`.
3. Insert a value at index position 2.
4. Remove a student name using `remove()`.
5. Remove the last element using `pop()`.
6. Find the length of the list.
7. Sort the list in ascending order.
8. Reverse the list.
9. Count how many times a value appears in the list.
10. Find the index position of a specific value.
11. Create two lists and combine them.
12. Copy one list into another list.
13. Clear all elements from the list.
14. Find maximum value from a numeric list.
15. Find minimum value from a numeric list.
16. Find sum of all elements in a numeric list.
17. Create a nested list and access inner elements.
18. Convert tuple into list.
19. Check whether a value exists in the list or not.
20. Create a list using `range()` function.

Tuple Questions

1. Create a tuple with 5 integer values.
2. Find length of the tuple.
3. Access the first and last element of tuple.
4. Find index position of a value in tuple.
5. Count occurrence of a value in tuple.

6. Convert tuple into list.
7. Convert list into tuple.
8. Create a tuple with mixed datatypes.
9. Slice first 3 elements from tuple.
10. Reverse the tuple using slicing.
11. Check whether an element exists in tuple.
12. Concatenate two tuples.
13. Repeat tuple elements using multiplication operator.
14. Create single element tuple correctly.
15. Find maximum value from numeric tuple.
16. Find minimum value from numeric tuple.
17. Find sum of elements in tuple.
18. Unpack tuple values into variables.
19. Create nested tuple and access inner values.
20. Iterate through tuple using loop.

Dictionary Questions

1. Create a dictionary with student name and marks.
2. Access a value using key.
3. Add a new key-value pair into dictionary.
4. Update an existing value in dictionary.
5. Remove a key using pop().
6. Remove the last inserted item using popitem().
7. Display all keys from dictionary.
8. Display all values from dictionary.
9. Display all items from dictionary.
10. Check whether a key exists in dictionary.
11. Find length of dictionary.
12. Copy one dictionary into another.

13. Clear all items from dictionary.
14. Create dictionary using fromkeys().
15. Get value of a key using get() method.
16. Iterate through dictionary using loop.
17. Merge two dictionaries.
18. Create nested dictionary and access inner values.
19. Convert dictionary keys into list.
20. Sort dictionary keys and display them.
