

## Graphical Installer (.pkg) for macOS

This is the easiest for most users.

### Step 1: Download the Installer

1. Go to the official website: <https://www.anaconda.com/download>.
2. You may need to enter your email (or skip registration).
3. Select the **64-Bit (Apple Silicon) Graphical Installer** for macOS under Anaconda Distribution. (The site usually auto-detects your Mac type.)

**Reference Image Idea:** The download page shows options for different OSes with clear buttons for Graphical Installer (.pkg) vs. Command-line (.sh). Look for the macOS section.

### Step 2: Run the Installer

1. Open your **Downloads** folder and double-click the downloaded .pkg file (e.g., Anaconda3-202X.XX-MacOSX-arm64.pkg).
2. The Installer window opens. Click **Continue**.
3. Read the **Read Me** instructions and click **Continue**.
4. Review the **License Agreement** (Terms of Service). Click **Agree** if you accept.
5. Choose the install location:
  - **Recommended:** "Install for all users of this computer" (installs to /opt/anaconda3).
  - Or "Install for me only" if preferred.
6. Click **Install**. You may need to enter your Mac admin password.
7. Wait for the installation to complete (it may take several minutes as it installs Python, conda, packages, etc.).
8. Click **Close** when done.

**Reference:** Screenshots typically show the standard macOS installer wizard with Continue/Agree/Install buttons.

### Step 3: Verify the Installation

1. Open **Terminal** (search via Spotlight: Cmd + Space, type "Terminal").
2. Type `conda --version` and press Enter. You should see something like conda X.Y.Z.
3. Type `conda list` to see installed packages.

4. You should see (base) in your prompt, indicating the base conda environment is active.
- Open **Launchpad** and search for **Anaconda-Navigator** to launch the GUI for managing packages/environments.

#### **Step 4: (Optional but Recommended) Initialize Conda**

If conda command is not found:

Bash

conda init zsh *# or bash, depending on your shell*

Then restart Terminal.

#### **Alternative: Command-Line Installer (.sh)**

Use this for more control or scripting:

1. Download the .sh version from the same download page.
2. In Terminal, navigate to Downloads: `cd ~/Downloads`
3. Run: `bash Anaconda3-202X.XX-MacOSX-arm64.sh`
4. Follow the prompts (press Enter to review license, type yes to agree, choose install location).
5. Initialize with conda init at the end.
